

Agentic-first to agentic-enabled to agentic-native

Three stages. Most companies confuse stage one for stage three. Knowing which one you're at changes what you optimize for next quarter.

01

Agentic-first

Experiments. Side projects. A few people running Claude in tabs. Optimize for: signal on what works, not productivity.

02

Agentic-enabled

Real workflows get assisted. Reps, marketers, ops people use agents in their day jobs. Optimize for: training, guardrails, data quality.

03

Agentic-native

The org couldn't function without agents in the loop. Optimize for: org design, monetization, and what only humans should still touch.

Stage one with a stage three budget

Most teams skip the middle. They buy enterprise-grade tooling for hobbyist-grade workflows. Map your stage first, then spend.
