

Decentralize experimentation. Centralize production.

How to let every employee build with AI without your stack turning into spaghetti in six months.

01

Decentralized experimentation

Every employee builds their own hacks for their own work. Prompts, GPTs, small automations. Encourage it. No approval queue.

02

Centralized production

The moment a hack becomes a process the org depends on, RevOps owns the rebuild. One source of truth. One on-call team.

Move it to RevOps when:

- 01 More than one person runs it weekly
 - 02 It writes to a system of record (CRM, billing, comp)
 - 03 A customer outcome depends on it working
 - 04 The builder is the only one who can fix it
-

Experimentation everywhere. Production in one place.

Anything else is a bowl of spaghetti by month six. We've seen it inside our own walls before we wrote the rule.
