

The four Lego pieces of any AI play

Once you can name the pieces, you can build any agentic workflow your team needs.

01

A smart intern

An LLM that can read context, reason, and write — the reasoning layer every other piece plugs into.

02

Web search

The agent's view of the outside world — fresh signals on companies, people, news, funding.

03

A data platform

Your CRM and warehouse — the system of record the agent reads from and writes back to.

04

A workflows agent

The engagement layer — what actually sends the email, posts in Slack, updates the deal, books the meeting.

Snap the four pieces together. That's the play.

Every agentic GTM workflow we ship is some mix of these four. Nothing more exotic.
